Theorem 1.1. *Show that the hom-functor preserves limit, that is, for any $Y \in \mathcal{C}$ and diagram \mathcal{D} , we have:*

$$\text{Lim}(\mathcal{C}(Y, \mathcal{D}_-)) \cong \mathcal{C}(Y, \text{Lim } \mathcal{D})$$

Proof. We may consider the cone with singleton set as vertex:

where const_{p_i} is the function that takes a morphism $p_i \in \mathcal{C}(Y, \mathcal{D}_i)$.

We know there is a one-to-one corresponding between u and the pair $\langle \text{const}_{p_i}, \text{const}_{p_j} \rangle$:

$$[\mathcal{J}, \mathbf{Set}](\Delta_1, \mathcal{C}(Y, \mathcal{D}_-)) \cong \mathbf{Set}(1, \text{Lim}(\mathcal{C}(Y, \mathcal{D}_-)))$$

or we can simplify the equation by defining $F_j = \mathcal{C}(Y, \mathcal{D}_-) : \mathcal{J} \rightarrow \mathbf{Set}$.

$$[\mathcal{J}, \mathbf{Set}](\Delta_1, F) \cong \mathbf{Set}(1, \text{Lim } F)$$

We may recall that the hom-set maps out from 1 is isomorphic to the target, that is:

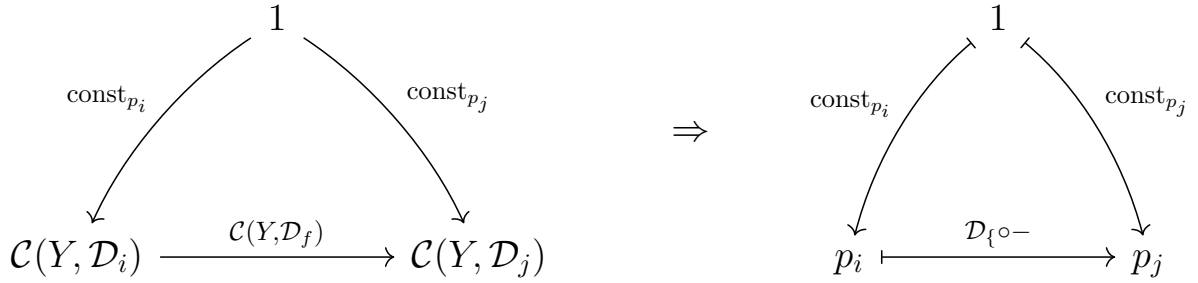

$$\mathbf{Set}(1, \text{Lim } F) \cong \text{Lim } F$$

Similarly, the cone with 1 as vertex is a pair of selection of $\mathcal{C}(Y, \mathcal{D}_i)$, it

forms a cone with Y as vertex:

the diagram is indeed commutes since

Also we can make a pair of selection of $\mathcal{C}(Y, \mathcal{D}_-)$ from a cone with Y as vertex.

Then the cone of $\mathcal{C}(Y, \mathcal{D}_-)$ with vertex 1, is isomorphic to the cone of \mathcal{D}_- with vertex Y :

$$[\mathcal{J}, \mathbf{Set}](\Delta_1, F) \cong [\mathcal{J}, \mathcal{C}](\Delta_Y, D)$$

While the later one is isomorphic to the limit of \mathcal{J}_\bullet :

$$[\mathcal{J}, \mathcal{C}](\Delta_Y, D) \cong \mathcal{C}(Y, \text{Lim } D)$$

Finally, we have:

$$\begin{aligned}
 & \text{Lim } F \\
 & \cong \\
 & \mathbf{Set}(1, \text{Lim } F) \\
 & \cong \\
 & [\mathcal{J}, \mathbf{Set}](\Delta_1, F) \\
 & \cong \\
 & [\mathcal{J}, \mathcal{C}](\Delta_Y, D) \\
 & \cong \\
 & \mathcal{C}(Y, \text{Lim } D)
 \end{aligned}$$
